

Reduction of ink sedimentation
in the tanks and agglomerated poured into
the digital machine.

1

2

Reduction of maintenance costs of digital
printers. Cleaner inks inside machine circuits
increase lifespan of printing heads and filters.

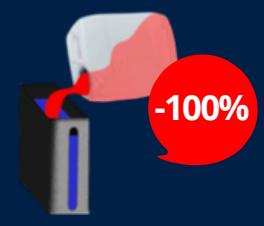

Reduction of transport cost: a container can
load 22.000 Kg/inks in IBC instead of only 14.000
Kg/inks in jerry cans.

3

4

Elimination of human mistakes.

**Machine downtime and operator intervention
reduction:** less printing heads purge and
cleaning.

5

6

Worldwide plastic reduction.

I-NKFILLER®:

I-NKFILLER® is the most widely used automatic filling system for digital inks, materials and glues. Used by leading ceramic companies (over a hundredseventy installations) to automatically, continuously and quickly feed digital printer reservoir tanks.

Printing defects caused by ink-related problems (sedimentation of rheological variation) can significantly reduce the value of finished products.

For this reason, it is an essential requirement that inks and digital materials are properly stored, checked, filtered and fed continuously without the need for operator intervention.

CIRCULAR ECONOMY

CLEAN and TIDY WORKSPACE

IMMEDIATE and FUTURE RETURN

Interconnected with **ERP, MES SCADA**

3 UNITS in the **1° YEAR**

10 UNITS in the **2° YEAR**

100 UNITS in the **4° YEAR**

We foresee that within **5 years** no one will use the cans anymore but all **I-NKFILLER®!!**
